Cranberries

Cranberries are considered a staple around the holiday season, but really can be enjoyed year round. For those with chronic kidney disease, many fruits contain too much potassium to be consumed on a daily basis. Cranberries are very low in potassium and you can eat them every day if desired as one cup contains only 80 milligrams of potassium.

Cranberries are a good source of vitamin C and fiber. Very few fruits or vegetables can beat the disease fighting antioxidant content of these small fruits.

To enjoy the benefits of these power packed berries, have cranberries frequently. They are available fresh, frozen and dried and can be added to the diet in a variety of ways. Add them to your hot or cold cereal. Enjoy a small glass of cranberry juice. For extra color and flavor, add them to your favorite baked goods such as muffins, yeast breads and cookies. You can also use them in poultry and pork recipes for a delicious twist.
